

SOLUTION ARCHITECTURE

Visualization Tool for Electric Vehicle Charge and Range Analysis

Architecture Overview

The solution architecture illustrates the overall workflow of the Visualization Tool for Electric Vehicle Charge and Range Analysis. The system collects electric vehicle datasets, stores them in a MySQL database, processes the data using SQL queries, and visualizes the results through Tableau dashboards. Users interact with the dashboards to analyze electric vehicle performance and charging infrastructure.

Architecture Diagram

Components

Component	Description
Dataset	Stores electric vehicle information
MySQL	Database for managing EV data
SQL	Retrieves and processes the data
Tableau	Creates dashboards and visualizations
User	Views reports and analyzes EV information

Conclusion

The proposed architecture provides an efficient flow of data from collection to visualization. It enables users to interact with electric vehicle information through an easy-to-use Tableau dashboard, improving analysis and decision-making.
