

PROBLEM STATEMENT

Visualization Tool for Electric Vehicle Charge and Range Analysis

Persona:

Electric Vehicle Buyer / EV User

Problem Statement:

I am an electric vehicle user who wants to compare electric vehicles based on driving range, charging facilities, efficiency, and price before making a purchase.

I am trying to identify the most suitable electric vehicle and understand the availability of charging stations to make informed decisions.

But I find it difficult to collect accurate and complete information because the data is scattered across multiple websites and reports.

Because there is no single platform that provides interactive analysis of electric vehicle specifications, charging infrastructure, and performance.

Which makes me feel confused while selecting the right electric vehicle and planning long-distance travel.

Objective:

The objective of this project is to develop an interactive Tableau dashboard that integrates electric vehicle and charging station data to help users compare vehicles, analyze performance, and make better purchasing decisions.

Expected Outcome:

The proposed solution enables users to visualize electric vehicle data through interactive dashboards, improving decision-making and providing clear insights into range, efficiency, pricing, and charging infrastructure.
